

# Steel Building Frames

Steel building frames offer a versatile construction solution. They are exceptionally strong, lightweight and flexible which means they are used for a variety of industrial, residential and temporary building structures.

All Lewis & Raby's steel frames are bespoke and fabricated to our customers' drawings.

Most of our steel building frames are manufactured in mild steel and can be bolted, riveted or welded together.

The framework can be galvanised and paint-finished before being delivered in pieces for straightforward assembly and on-site installation.

Please contact our experienced engineering team to discuss your specific requirements.
