

## Tablet Press Turrets

Rotating turrets are the critical components of any rotary tablet press machine used in the pharmaceutical industry. We manufacture and refurbish any size of tablet press turret to our customers' requirements.

Our turrets are precision machined using a Goratu Geminis GHT-5 Lathe. Accurate dimensional and rotational tolerances on all diameters and bores ensures that punch guides and die pockets are fully aligned.

The turrets can be made from a range of metals including cast iron grade 300/350 or stainless steel.

We also offer external gear cutting for turrets and phosphor bronze bushing. Phosphor bronze combines toughness and strength with a low friction rating.

We manufacture similar turrets for a range of industries and applications. Please contact our engineering team to discuss your specific turret requirements.
