

## Twin Shaft Vacuum Mixer

Large commercial and industrial mixers are used for a variety of applications including the production of industrial lubricants, paints, glues, cosmetics, resins and food stuffs.

Lewis & Raby can manufacture a range of mixing mills including the twin shaft vacuum mixer featured here which is used in the production of industrial lubricants.

The main body of the unit is constructed in mild steel. The mixing blades are manufactured in stainless steel and the driveshaft is chromed and ground to increase resistance to wear.

The vacuum mixing environment ensures that the lubricant is fully dispersed and homogenised.

All our mixers are manufactured to our customers' individual specification and are paint finished. We can also install the mixer on site.

You can find out more about our commercial food mixers [here](#) or you can contact our engineering team to discuss your requirements.
