Lewis & Raby Engineers Ltd

Distribution Transformer Tanks

Lewis & Raby is a manufacturer of distribution transformer tanks used in electricity networks.

A distribution transformer provides the final voltage transformation in an electric power distribution network, changing the voltage to a level which can be used by households, businesses and in industrial settings.

The tank is a critical component of the distribution transformer housing the core, windings and cooling oil.

Lewis & Raby's distribution transformer tanks are fabricated from laser cut carbon steel. All our tanks are shot-blasted before being painted and protected from corrosion according to our customers' specifications.

We also manufacture all metal components for the distribution transformer including terminal cable boxes, turrets, covers and conservators.

Our distribution transformer tanks are made to our customers' specifications in accordance with the ISO 9001 standard.

Please contact our experienced engineering team to discuss your requirements.
